

# V 4.0 Digital EFIE wiring

We have made a new revision to our DIGITAL EFIE. In this new release we have added a CAT5 connection and supplied a standard CAT5 cable with a connector at one end. This will make wiring the unit even easier. Simply strip back the CAT 5 wire to expose the color coded pairs. Power, Ground, and O2 SENSOR inputs and outputs no longer need to be connected manually to the board. You also do not have to open the unit to make connections.
